

Enhancing Energy Company Substation Connectivity

Digi ConnectPort TS provides a resilient SCADA connectivity solution.

Challenge

To ensure that their front-end servers could communicate with individual remote terminal units (RTUs), one of America's largest electric and natural gas holding companies needed to establish a more reliable connection between substation RTUs and a SCADA data collector.

Solution

Digi's terminal server solution, **Digi ConnectPort**, enables large-scale SCADA monitoring of multi-location RTUs. This solution allowed operators monitoring the transmission system to keep track of issues in the field and control various devices remotely.

Outcome

Digi's monitoring solutions helped deliver power reliability and safety for more than 8.2 million customers. This resulted in a happy customer base and stress-free operations.

Explore Digi Connect EZ TS

"The terminal server that Digi provides allows our front-end computers to communicate to the individual station remote terminal units and monitor any potential issues with voltages and megawatt flows."
