

Extend the Life of Existing Water Infrastructure

Digi monitoring solutions bring life to aging water management systems.

Challenge

Water is an essential part of daily living and core to every municipality foundation. When aging water management infrastructure threatened operations at a Georgia utility, they turned to Digi for a solution that automates the measurement of water levels, pressurization and demand, as well as potential issues across their water supply and stormwater network.

Solution

Digi Connect® Sensor XRT-M and **Digi Axxess** seamlessly integrated into existing water operations, allowing for swift detection of low pressurization and overflow events. This proactive approach prevents small issues from becoming major problems down the line.

Outcome

Digi brings peace of mind to city streets, providing visibility to flooding issues during storms and optimizing network pressurization during peak demand. With automation solutions in place, cities can significantly reduce labor costs while prolonging the life expectancy of existing infrastructure — all without disruption or downtime!

“With Digi’s solution, we went from being reactive to water events to proactively preventing them.”
