

High-Bandwidth Continuity for Branch Networking

Enable complex network management and scalability for multiple locations

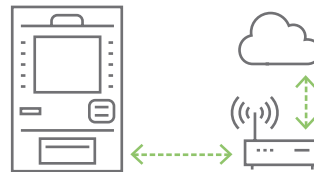

Retail operations have increased in complexity with advances in the Internet of Things. More systems must be connected, and there is a greater need for speed, throughput, reliability and security.

Your branch network must support a range of devices, applications and peripherals to maintain point-of-sale terminals, digital signs and kiosks, inventory tracking, transaction processing and more. Reliable connectivity and business continuity are critical to sales, productivity and success in any retail networking environment.

Business Continuity

Eliminate downtime and keep all your operations running smoothly with Digi Enterprise Solutions that maintain critical networks across high-bandwidth applications. As growing networks host more applications, service disruption can have broader consequences. Downtime costs such as lost sales and productivity add up quickly and negatively impact brand perception and reputation.

Bring Your Own Network

Regardless of where your systems are installed, today you can ensure full redundancy, secure connectivity, and the remote management capabilities for visibility and control across the network with Digi Remote Manager® (Digi RM). When a router is deployed, Digi RM retains a full copy of the configuration, which simplifies both the initial installation and ongoing management.

Deploy primary and failover connectivity to any location quickly and seamlessly with integrated Digi hardware, zero-touch provisioning and cloud-based management. Rapidly expand and add dynamic flexibility for new branch locations, pop-up stores, stores-within-a-store, and digital signage to meet your customer engagement and growth strategies.

Software Defined

Leveraging the power of the cloud, Software-Defined Wide Area Networks (SD-WAN) add redundancy and let businesses scale bandwidth on demand. As operations expand geographically, employees may no longer be able to access corporate applications on their local WAN. With optimized SD-WAN, you can maintain high performance and uptime across all branch applications with optimized [SD-WAN](#) throughout your network.

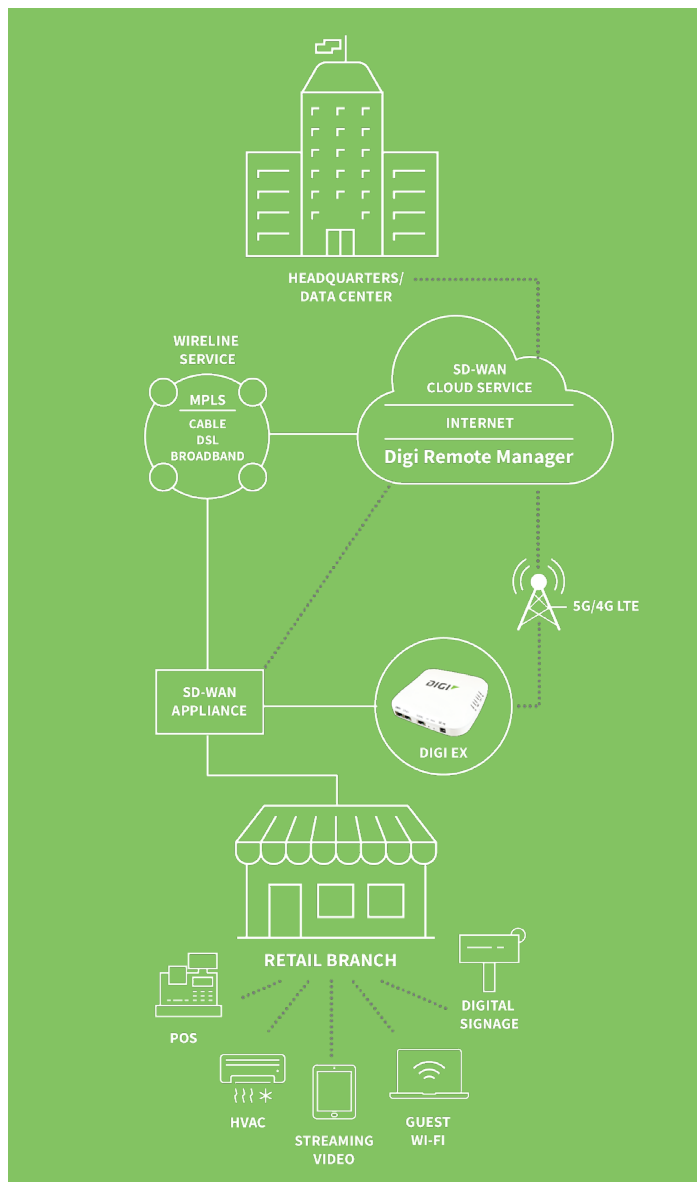

Ready to Evolve

As branch and retail networks evolve, Digi Enterprise solutions with dual connectivity enable businesses to future proof their deployments. [Digi 5G solutions](#) adapt and effectively solve connectivity challenges and allow you to easily integrate with existing infrastructure. If a connection is interrupted because of a gap in 5G coverage, the device will seamlessly switch between 5G and 4G LTE without interruption and loss of data.

Built-in Security

Protect your investment and prepare for what's next. Secure data and revenue streams, maximize uptime, monitor the network to identify threats and leverage smart systems that automatically address potential issues. Digi products feature the built-in [Digi TrustFence](#)® framework, which augments device security with identity and data protection features that can quickly adapt to new and evolving threats.

Supercharge SD-WAN Speed and Security with Digi Enterprise Solutions

Digi Enterprise and SD-WAN solutions boost speed, access and reliability across branch locations to eliminate downtime, simplify deployment and reduce overall cost. Digi EX solutions enable businesses to future-proof their deployments for applications that require higher speed and bandwidth than are possible with 4G. Establish secure, managed, high-performance connectivity with Digi solutions.
