

Industrial Generator Management Power Monitoring and Control

Digi's industrial generator management system helps municipalities, health and safety facilities, and commercial enterprises oversee emergency power infrastructure with ease.

Easy Integration

Digi's smart, automation-ready controller integrates over a Modbus (TCP or RS-485) interface on newer generators, or via discrete input on older models. Communicate with stationary, mobile and remote generators over wired or wireless cellular networks.

Operations Monitoring

Don't let a minor issue grow into a disaster. Digi allows you to maintain consistent day-to-day operations by monitoring pre-determined critical activity including generator faults, battery voltage, fuel levels and temperatures, oil pressure, and more.

Remote Control Access

Manage repairs and more from anywhere. Digi puts the control in your hands with remote functions including start-up and preventive maintenance. You can also manage electrical loads, clear faults, transfer fuel, and regenerate filters.

Alerting and Reporting

Once thresholds are determined, Digi alerts you to any issues via text message and email. Extensive logging and cloud-based reporting allow for easy analysis.
